The receptor is useful for the investigation, diagnosis, treatment and prevention of diseases associated with GTP-binding protein-coupled receptors, including neurological, circulatory, digestive system, immune system, muscle and urinary system disorders. GTP-binding proteins are also known as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1248

                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a human G protein-coupled receptor AXOR34 and the polynucleotide encoding it. The sequences of the invention are used for treating and/or a variety of diseases, including bacterial, fungal, protozoan and viral infections (particularly infections caused by HTV), pain, cancers, diabetes, obesity, anorexia, bullimia, Parkinson's disease, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, stroke, ulcers, allergies, benign prostatic hypertrophy, migraine, vomiting, psychotic and neurological disorders (including anxiety, schizophrenia, manic depression, depression, delirium, dementia and severe mental retardation) and dyskinesias (such as Huntington's disease and Gilles de la Tourette's syndrome). This sequence represents cDNA encoding the human AXOR34

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to human G-protein coupled receptors, SNORF62 and SNORF72 and their corresponding cDNA molecules. SNORF62 and SNORF72 receptors are specific for neuromedin U (NMU) neuropeptides, hence they are also known as NMU receptors. The agonist and antagonist of NMU receptors are useful for treating an abnormality in a subject that is alleviated by decreasing or increasing the activity of NMU receptor. The NMU receptors serves as a valuable tool for designing drugs which are
                                                                                                                            disorders, somatosensory disorders, metabolic disorders, behavioural disorders, drug addiction, migraine, Addison's disease, Cushing's disease, prevent miscarriage, induce labour or to treat dysmenorrhoea

                                                                                                                     The invention relates to human and rat neuromedin U receptor designated NMUR2 polypeptides and polynucleotides. NMUR2 also referred as FM-4, is free from associated proteins and is involved in the feeding behaviour in mammals. Sequences of the invention are useful for identifying compounds which modulate the feeding activity of a mammal. The compounds identified are useful for modulating eating and weight gain. The present sequence is human NMUR2 cDNA.
                                                                                                                                                                                                                                                                                                                                 New polypeptide, useful for identifying compounds feeding activity of a mammal, comprises the novel rat neuromedin U receptor designated NMUR2 -
                                                                                                                                                                                                                                                                                                                                                                                                                        P-PSDB; AAE14262

The NLR polynucleotide and protein can be used to isolate compounds that bind, (ant)agonise or alter the activity or expression of the NLR. The NLR is a G-protein coupled receptor which is expressed in the central nervous system and shares homology with human neurotensin receptor. The receptors can be used in

Agonists or antagonists of IGS4 are effective with regard to disorders of the nervous system, including the central and peripheral nervous systems, disorders of the gastrointestinal system, cardiovascular systems, beletal muscle, thyroid, lung or genitourinary system, or immunological disease. The IGS4 polynucleotides are useful as diagnostic reagents for detecting under-expression,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         system, psychiatric and central nervous system disorders (e.g. schizophrenia, episodic paroxysmal anxiety, phobia, Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence encodes a splice variant of the long version of a human G-protein coupled receptor designated IGS4A. IGS4 exists in two polymorphic forms, IGS4 and IGS4B. The IGS4 receptors and IGS4 polynucleotides are useful for preventing, ameliorating or correcting dysfunctions or diseases. These diseases include peripheral nervous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               overexpression or altered expression of IGS4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          disorders,

```

The present sequence encodes a splice variant of the short version human G-protein coupled receptor designated IGS4A. IGS4 exists in polymorphic forms, IGS4A and IGS4B. The IGS4 receptors and IGS4

hypertension), dyslipidemias, obesity, emesis, gastrointestinal disorders (e.g. inflammatory bowel disease or motility disorders), osteoporosis, inflammations, infections (e.g. bacterial, fungal, protozoan or viral), pain, cancers, immune disorders, allergies, sepsis or gynecological disorders. Agonists or antagonists of IGS4 are effective with regard to disorders of the nervous system, including the central and peripheral nervous systems, disorders of the gastrointestinal system, cardiovascular system, skeletal muscle, thyroid, lung or genitourinary system, or immunological disease. The IGS4 polynucleotides are useful as diagnostic reagents for detecting under-expression, overexpression or altered expression of IGS4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              system, psychiatric and central nervous system disorders (e.g. schizophrenia, episodic paroxysmal anxiety, phobia, Parkinson's disease, migraine, epilepsy, bulimia or stroke), cardiovascular disease
